sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence 1s selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length AAH13613 to AAH13612 represent human cDNA sequences; AAB92446 to AAH13631 represent human anno acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification of the complification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 2756 BP; 911 A; 438 C; 542 G; 865 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 1

Institute for Genomic Research (TIGR), Rockville, MD.
Genomic DNA isolated from broth cultures of E. histolytica
using a method described by clark and Diamond (Clark,
C.G., and Diamond, L.S. (1993) Entamoeba histolytica: a
method for isolate identification. Exp. Parasitol.
77:450.). The DNA was mechanically sheared to give a
tight size distribution of "2 kBo." The v + i method used for
the library construction is described in detail in Smith,
H.O. and Venter, J.C. (Making small insert libraries for
whole genome shotgun sequencing projects. In Genome
Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barell, Oxford University Press, 1999)."

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high malar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (qi|4732114qb)AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chanically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

/note="vector: pBluescript SR-; Site_1: EcoRI; Site_2:
XhoI; cDNA was prepared from 2ug of poly A+ RNA.
EcoRI-XhoI cut cDNA was then ligated into Unizap-XR
(Stratagene) with EcoRI at the 5' end and XhoI at the 3'
end. SS-library phagemids were prepared by mass excision from the original library and normalized by hybridization
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

Library constructed by Bruce Blumberg
Library constructed by Jihwan Song
Library normalized by Jihwan Song
DNA Sequencing by: Washington University Genome Sequencing Center
Clone distribution: Xenopus clone distribution information for
this library can be found through Research Genetics, visit their
web page at: http://www.resgen.com/ please reference the id listed
below when ordering this clone: Source lab clone id - xlnnoc003n05
Seq primer: -400p from Gibco
High quality sequence stop: 488.
to biotinylated driver (prepared from the same library by PCR) to Cot-omega of 11. After removal of hybrids and excess driver by streptavidin sepharose chromatography, the ss-phagemids were made double stranded and electroporated into Top-10 F'. Original library confruction by Bruce Blumberg (Blumberg et al., 1991 Science 253, 194196; Hawlet et al., 1995, Genes Dev. 9, 2923-2935). Note: This is a Xenopus Gene Collection (XGC)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-BJOP
library is a subtracted library derived from the UI-R-BJOP
UI-R-AGI, UI-R-AGI, UI-R-AGI, UI-R-AGI, UI-R-AGI
UI-R-AGI libraries. These libraries represent tissues from
rat atrium at 16.5 dpc, ventricle at 16.5 dpc, AV canal
at 16.5 dpc, and ventricle at 13 dpc. AV canal
string of 5-6 nucleotides present between the Not I site
and the oligo-dr track. The library was constructed as
described by Bonaldo, Lennon and Soares, Genome Research
                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                            EST 06-MAR-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Email: msoares@blue.weeg.uiowa.edu
The sequence contained an oligo-dT track that was present in the
oligonucleotide that was used to prime the synthesis of first
strand cDNA and therefore this may represent a bonafide poly A
tail. The sequence tag present in the cDNA between the Notl site
and the oligo-dT track served to identify it as a clone from the
normalized AV canal at 16.5 dpc library cDNA Library Preparation:

//doce="Vector: pSPORT1 (Gibco/BRL Life Technology);
Site_1: Sal1; Site_2: Not1; Total RNAs were extracted from
7 NewDorn Ovary. The double-stranded cDNA was synthesized
by Gibco's kit with an Oligo(dT) primer [Not1
primer-adapter from GibcoRRL]
[5'-pGCTPACTTCAGATCCGGGCGCCCCTTTTTTTTTTTTTTT]
2.56ug of total RNA. The double-stranded cDNAs were
treated with T4 DNA polymerase and purified by
ethanol-precipitation. The cDNAs were ligated to
Lone-linker LL-Sal3 (include Sal1 sequence). The cDNAs
were purified by phenol/chloroform and separated from
free linkers by Centricon 100. Then, cDNAs were amplified
by long-range high fidelity PCR using Takara's Ex Tag
polymerase. Then, the CDNAs were purified by
phenol/chloroform and by Centricon 100. The cDNAs were
digested with Sal1 and Not1 enzymes. Then, the CDNAs were
closed into Sal1/Not1 site of pSPORT1 plasmid
vector. The DH10B E. coli host was transformed with the
ligation mixture by chemical method. The library was
constructed by Xiaohong Wang and Yulan Plao."

// 
oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site and the oligo-dr track served to identify it as a clone from the normalized thalamus library cDNA Library Preparation: M.B. Soares Lab Clone distribution: clones will be available through Research

On Jun 27, 2001 this sequence version replaced gi:14270608. On Jun 27, 2001 this sequence version replaced from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AL513122 108930 bp DNA linear PRI 26\text{-JUN-}2001 Human DNA sequence from clone RP11-477J21 on chromosome 9, complete sequence.

Coconut foliar decay virus DNA, clones NMORG, poRG, and pORGSAUJA..

Coconut foliar decay virus

Viruses; ssDNA viruses;

(bases 1 to 1291)

(coconut foliar decay, Nanovirus)

Nucleotide sequence of a circular single-stranded DNA associated with coconut foliar decay virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

This sequence was finished as follows unless otherwise noted: all regions were either double stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone, and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, database can be found at http://www.sanger.ac.uk/Projects/C\_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human crhomosome 9, constructed by the Sanger Centre Chromosome 9 Mapping Croup. Purther information can be found at http://www.sanger.ac.uk/HGPP/Chr9 RPP11-477321 is from the library RPCI-11.2 constructed by the group of Pieter de Jong. For further details see http://www.chri.org/bacpac/home.htm IMPORTANT: This sequence is not the entire insert of clone RP11+47721 It may be shorter because we sequence overlapping sections only once, except for a 100 base overlap. The true right end of clone RP11-47721 is at 108930 in this sequence. The true left end of clone RP11-342H3 is at 29985 in this sequence. The true right end of clone RP11-165P4 is at 100 in this 5296 .5413 . ---- matches 4908 .5022 of consensus" 5414 .5637 . ---- matches 1 .216 of consensus" 5638 .598 .5980 1973. .2675 //note="LiMC4 repeat: matches 6783. .7492 of consensus" 1187. .1672 /note="LiMC4 repeat: matches 7492. .7975 of consensus" 5008. .5134 /note="LiMB1 repeat: matches 6042. .6168 of consensus" 5296. .5418 5210. .6327 /note="HERVL repeat: matches 4794. .4908 of consensus" 9941. .6209 /note="MLTIG repeat: matches 216. .510 of consensus" 605. .725 /note="L2 repeat: matches 2624. .2746 of consensus" /note="MER21B repeat: matches 6. .201 of consensus" repeat: matches 2589. .2710 of consensus" 379. .1178 note="AluJb repeat: matches 1. .309 of consensus" 1673. 1972 /note="Alusx repeat: matches 1. .304 of consensus" 1252. .4523 /note="AluSg repeat: matches 1. .283 of consensus" 638. 5940 note="Alusg repeat: matches 1. .302 of consensus" 328. 6781 /note="MLTlJ repeat: matches 1. .516 of consensus" 3053. .3202 /note="MIR repeat: matches 82. .248 of consensus" /organism="Homo sapiens" /clone\_lib="RPCI-11.2" 1. .187 /db\_xref="taxon:9606" /chromosome="9" /clone="RP11-477J21" Location/Qualifiers 4641. .4753 /note="L2 re 5008. .5134 .108930 pBACe3.6 1973. sednence repeat\_region source
